

MCMT Homework 3

Shun Zhang

Exercise 3.1

Assume that $\pi(x) = 0$ for a $x \in \Omega$. Because $\pi P = \pi$, $\sum_{i \in \Omega} \pi(i)P(i, x) = \pi(x) = 0$. Consider state y such that $\pi(y) > 0$, then $P(y, x) = 0$. Because π is the stationary distribution for P , so $\pi P^t = \pi$, $P^t = P$, for arbitrary $t \geq 1$. So $P^t(y, x) = 0$ for arbitrary $t \geq 1$. This chain is not irreducible. Contradiction.

Exercise 3.2

Check the distribution at state x , $\pi P_x = \sum_{i \in \text{adj}(x)} \pi(i)P(i, x) = \sum_{i \in \text{adj}(x)} \frac{\deg(i)}{2|E|} \frac{1}{\deg(i)} = \sum_{i \in \text{adj}(x)} \frac{1}{2|E|} = \frac{\deg(x)}{2|E|} = \pi(x)$, where $\text{adj}(x)$ is the neighbor set of x , with the size of $\deg(x)$.
